                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PAPP-E isoform
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        one of three new isoforms of human pregnancy associated plasma protein hPAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform
                                                                                                                                                                                                                                                                                                 PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Administration of antisense or triplex forming oligonucleotides which bind polypurine tracts (PPT) may be used in the therapy or treatment of individuals infected with retroviruses or hepadna viruses since in these two families of viruses, two primers are involved in the reverse transcription of viral RNA into double cranded DNA, one of which is a PPT. The antisense or triplex forming oligonucleotides can inhibit the early stages of viral replication by binding to the PPT primer or by binding to PPT reacts in the RNA-DNA hybrid molecule formed after reverse tracts in the RNA-DNA hybrid molecule formed after reverse tracts in the RNA-DNA hybrid molecule formed after reverse transcription of the viral RNA. This oligonucleotide was incubated with an in vitro transcribed 5 end labelled pKJ2 RNA of 134 uncleotides in length to which a 40-mer deoxyribonucleotide complementary to the PPT had been hybridised. The presence of this sequence led to protection of the pKJ2 RNA-DNA hybrid from RNAse H of digestion which would suggest the formation of a triplex. Triplex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        vitro by reverse transcriptase in the presence of oligodeoxynucleotides including one which was radioactively labelled. The newly synthesised DNA was terminated at the site of the PPT when
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the triplex was formed and blocked extension. Triplex formation would be expected to interfere with viral replication in vivo. See AAQ45381-Q45417. This is a variant of the sequence described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                formation was confirmed using a primer extension technique. A primer binding downstream of the PPT was synthesised and extended in

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fime-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase in (fit-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                           Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fme-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Shrimp white spot Bacilliform virus (WSBV) oligonucleotide 158.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 10; DB 18; Length 27; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides the primary nucleotide sequence of the WSBV genome (AAH62689), predicted transcript sequences (AAH62689-AAH62839) and encoded proteins (AAG8940-AAG88261) and oligonucleotide sequences (AAH62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agence and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create
                                                                                                                                                                                                                                                                                                                                                                         Primary nucleotide sequence of the shrimp white spot Bacilliform virus (WSBV), useful for producing viral polypeptides that can be used to screen for agents that are useful for treating WSBV infection -
Shrimp white spot Bacilliform virus; WSBV; diagnosis; viral infection; antiviral agent; gene expression; antisense construct; probe; primer; transgenic viral resistant shrimp; ss.

primer extension (SNPE) primers, and the sequences of regions flanking stres of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotypic dan individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait sinclude disease e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfects and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human MSF; megakaryocyte stimulating factor; tribonectin; alternative splicing; joint boundary lubricant; O-linked oligosaccharide; osteoarthritis; tribosupplementation; tissue adhesion inhibition; friction coefficient reduction; gene therapy; antiarthritic; osteopathic; reverse transcription-PCR; RT-PCR primer; ss.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents the production (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human CD36 polymorphism sequence variant oligonucleotide SEQ ID NO:133.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; rat; CD36; SHR; spontaneous hypertensive rat; diagnosis; therapy; screening; polymorphism; variant; detection; mutant; blood; mutation; insulin; glucose metabolism; fatty acid metabolism; catecholamine; malaria; infection; parasite; antiparasitic;
                                                                                                                   Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding mutant CD36 proteins useful for preventing, diagnosing and treating parasitic infections, especially malaria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                             gene, The Infonectin has a least one villared oligosaccharded lubricating molety and has a polypeptide sequence comprising 1-76 repeats of a motif having at least 50% identity to the sequence KEPAPT repeats of a motif having at least 50% identity to the sequence KEPAPT (AAB29744). The invention also relates to a nucleic acid encoding a human MSF-derived tribonectin; a biocompatible composition comprising a human tribonectin for inhibiting tissue adhesion formation; and a method of diagnosing osteoarthritis or a predisposition to osteoarthritis by meammal, wherein an increased amount of MSF compared to a control indicates the presence of or predisposition to developing osteoarthritis. The tribonectin and DNA encoding it are useful in the treatment of osteoarthritis, where they may be used for lubricating mammalian joints, such as articulating joints of humans, dogs or horses. The tribonectin, when formulated as a membrane, foam, gel or fibre, is useful for inhibiting adhesion between two surfaces such as the injured or trauma, or an artificial device e.g., an orthopsactical insertion of tribonectin may be used in gene therapy. The present sequence represents a tribonectin may be used in gene therapy. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

concoding mutant CD36 proteins (B). Parasites such as Plasmodium falciparum (the major cause of malaria) are unable to utilise the mutant CD36 proteins (B). Parasites such as Plasmodium falciparum (the major cause of malaria) are unable to utilise the mutant cD36 proteins do not function correctly preventing parasites utilising them to infect cells. The mucleic acids may be used for the recombinant production of mutant CD36 proteins according to standard methodologies. They may be used in this way to prevent and treat parasitic infections that utilise the CD36 protein to infect cells, such as P. falciparum, then utilise the CD36 protein to infect cells, such as P. falciparum, identify modulators of CD36 expression and activity or a patient's CD36 by may be screened to determine whether there are any mutations present that may confer resistance to parasitic infections. The proteins and nucleic acids may also be used to prevent, diagnose and treat diseases associated with defects in insulin action and/or glucose metabolism cand/or fatty acid metabolism and/or catecholamine action in subjects possessing mutations in the CD36 genes AAA40606 to AAA40759, and AAB02515 to AAB02554, respectively which are used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

concoding mutant CD36 proteins (B). Parasites such as Plasmodium falciparum (the major cause of malaria) are unable to utilise the mutanted proteins to gain entry to, and infect cells. The mutant CD36 proteins do not function correctly preventing parasites utilising them to infect cells. The nucleic acids may be used for the recombinant production of mutant CD36 proteins according to standard methodologies. They may be used in this way to prevent and treat parasitic infections that utilise the CD36 protein to infect cells, such as P. falciparum, they may be used in this way to prevent and treat parasitic infections that utilise the CD36 protein to infect cells, such as P. falciparum, identify modulators of CD36 expression and activity or a patient's CD36 DNA may be screened to determine whether there are any mutations present concern resistance to parasitic infections. The proteins and nucleic acids may also be used to prevent, diagnose and treat diseases associated with defects in insulin action and/or glucose metabolism and/or fatty acid metabolism and/or catecholamine action in subjects possessing mutations in the CD36 genes AAA40666 to AAA40759, and AAB02515 to AAB025164, represent uncleotide and amino acid sequences in insulin action and and and activity action sin the cused in the exemplification of the present

The present invention describes isolated nucleic acid molecules (A) encoding mutant CD36 proteins (B). Parasites such as Plasmodium falciparum (the major cause of malaria) are unable to utilise the mutated proteins to gain entry to, and infect cells. The mutant CD36 proteins do not function correctly preventing parasites utilising them to function correctly preventing parasites utilising them to forduction of mutant CD36 proteins according to standard methodologies. They may be used in this way to prevent and treat parasitic infections. They may be used in this way to prevent and treat parasitic infections. They may be used to malaria. For example, the protein may be used to determine whether there are any mutations present chantify modulators of CD36 expression and activity or a patient's CD36 DNA may be screened to determine whether there are any mutations present that may confer resistance to parasitic infections. The proteins and nucleic acids may also be used to prevent, diagnose and treat diseases associated with defects in insulin action and/or glucose metabolism and/or fatty acid metabolism and/or catecholamine action in subjects possessing mutations in the CD36 genes AAA40606 to AAA40759, and ABB02515 to AAB02564, represent uncleotide and amino acid sequences represent in the exemplification of the present
                                                                                                           Nucleic acids encoding mutant CD36 proteins useful for preventing, diagnosing and treating parasitic infections, especially malaria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma bruce; (TREU92/14 GUTAT 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Maxing small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).

/Glone="DCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAC161. The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. Sequences displaying significant similarity to the A. thalaina nuclear genome sequence processed for submission. T-DNA derived sequences were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SALK 115724.25.30.n Arabidopsis thaliana TDNA insertion lines Arabidopsis thaliana genomic clone SALK_115724.25.30.n, genomic survey, sequence.

This sequence is recovered from the left border of the T-DNA. It
indicates an insertion close to or within gene At5942900. The
sequences are generated at the MPI for Plant Breeding Research in
the context of the GABI-Kat project. GABI-Kat is part of the German
Plant Genomics program designated 'GABI'. Information on line
availability can be found at:

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pMAPA2 (gql 47321141gbl AR129072.1); a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative adarose gelectrophoresis. Vector DNA was prepared from a derivative of pwh02 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Coli strain XL10-Gold, T1-resistant, F-"
/clone_lib="Mouse 10kb plasmid UUGCIM library"
/note==Tvector: PWD42rv; Purified genomic DNA from M.
musculus C57BL/G/ (male) was obtained from He Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1) a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (http://www.jax.org/resources/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with THE DNA polymerase and THE polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwhs2 (gi|4722114|gb|AF129072.1), a copy.number inducible derivative of plasmid RL. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xili0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Danio rerio genomic clone DKEY-61D1, genomic survey sequence.

// Lissue type="pooled germ cell tumors"
// Lissue type="pooled germ cell tumors"
// Lissue type="pooled germ cell tumors"
// Lissue type="pooled germ cell tumors and was then primed with a modified polylinker; lst strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3
vector. Library is normalized. Library was constructed by Bento Soares and M. Patima Bonaldo. "

(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymcleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pware (4722114)[gh]AP129072.1); a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XII0-Gold (stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  55 DP MRNA linear EST 15-AUG-2000 mRNA sequence. The library was constructed by Brandi Chiapelli and Dr. James McCarter at Washington University, St. Louis. Though was made by using Dynabead oligoity, St. Louis. The CDNA was made library using a modified protocol from the SMART PCR cDNA Synthesis Kit from Contech. Directionally cloned into the UDG sites of pAMPI. Nematodes were provided by Dr. Warwick Grant of AgRearch, New Zealand (warwick GrantGaglesearch.co.nz)."

Suzuki,Y., Yoshitcomo-Nakagawa,K., Maruyama,K., Suyama,A. and Sugano
Suzuki,Y., Yoshitcomo-Nakagawa,K., Maruyama,K., Suyama,A. and Sugano
a S.-end-enriched cDNA library. Gene 200 (1-2), 149-156 (1997)
This clone was obtained from a '5'-end-enriched' cDNA library
constructed by 'Oligo-Capping' method. The coding region starts
from the 50 bp upstream to the 3'-end.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                EST 04-MAY-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gi|4732114|gb|ARL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampleillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

AUZSB677 3'-directed mouse cDNA library Mus musculus cDNA clone
BED0013467 3', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                Submitted (17-50M-2002) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence is recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by clone F22B13. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the Carman Plant Genomics program designated 'GABI'. Information on line availability can be found at:

/note="Vector: Lambda Uni-ZAP XR; Site_1: Eco RI, Site_2: Xho I; Lymphatic filarial nematode parasite of humans.

MRNA was prepared from young adult worms isolated from the peritoneal cavity of jirds and converted to double-stranded cDNA using reverse transcriptase and oligo (dT) followed by RNase H and DNA pol I. The library has 6.5 x 104 independent recombinants and the average insert size is approx. BODbp. The library was constructed by Michelle Lizotte-Wanlewski. The library is available from Dr. S.A. Williams, email: genome@neal.smith.edu."

Xho I; Lymphatic filarial nematode parasite of humans.

RRMA was prepared from young adult worms isolated from the
peritomeal cavity of jirds and converted to
double-stranded cDNA using reverse transcriptase and
oligo(dT) followed by RNase H and DNA pol I. The library
has 6.5 x 104 independent recombinants and the average
insert size is approx. 800bp. The library was constructed
by Michelle Lizotte-Waniewski. The library is available
from Dr. S.A. Williams, email: genome@neal.smith.edu."

Xho I; Filarial nematode parasite of humans. mRNA was
prepared from approximately 9,000 L2s isolated from
infected mosquitoes from Kumba, Cameroon and converted to
double-stranded cDNA using reverse transcriptase and
oligo (d7) followed by RNase H and DNA pol I. The library
has 7.3 x 1084 independent recombinants and the average
insert size is approximately lkb.The library was
constructed by Michelle Lizotte-Waniewski. The library is
available from Dr.S.A.Williams, email: genome@emith.edu."

/note="Vector: Lambda Uni-ZAP XR; Site 1: Eco RI; Site 2:
Xho I; Filarial nematode parasite of humans. mRNA was
prepared from approximately 9,000 L2s isolated from
infected mosquitoes from Kumba, Cameroon and converted to
double-stranded cDNA using reverse transcriptase and
oligo(dT) followed by RNase H and DNA pol I. The library
has 7.3 x 10E4 independent recombinants and the average
insert size is approximately 1kb.The library was
constructed by Michelle Lizotte-Waniewski. The library is
available from Dr.S.A.Williams, email: genome@smith.edu."
